Glass Ionomer
Powder/Liquid Band Cement

A two part glass ionomer band cement system of powder and liquid. It is fluoride containing which reduces the incidence of decalcification. Resilience chemically bonds to enamel without the use of etchants. It has a low film thickness and will not wash out under bands. The final setting time is 6 to 7 minutes.

Glass Ionomer
Paste/Paste Band Cement

A multi-cure fluoride containing glass ionomer band cement in a two paste system which offers a dual curing capability. May be used with or without a curing light. After band placement and flash removal, light curing provides a quick set and protection from moisture. There is approximately a 3 minute working time from the beginning of the mix. The final set time is approximately 10 minutes without the use of a curing light.

Light-Activated Orthodontic Bonding Systems

Provides the optimum properties for bonding ceramic, metal, or plastic brackets using light-cure technology. The smooth, tacky composite resin delivers ideal handling characteristics which eliminate bracket flotation and allow for easy flash clean up. Light activation provides additional working time to ensure accurate bracket placement. Produces a strong light cured chemical bond which also debonds easily. Archwires can be placed immediately after fully curing the brackets. Contains fluoride to help protect against potential decalcification.

Light-Cure Band Cement
A light-activated band cement in a single component push syringe paste system which provides a longer working time and a rapid setting time. Can be placed directly into bands. Excess flash is easy to clean up prior to the light curing and the cement is easy to see due to the blue color. Contains fluoride to reduce the chance of decalcification.

Low Viscosity Light-Cure Flowable Composite
Resilience Low Viscosity Light-Cured Flowable Composite adhesive features a precision controlled syringe which prevents overflow and run-on. It ensures accuracy as it flows easily into difficult areas, but is reliable not to slump or run until light curing occurs. The disposable tip provides precise application, accessibility, and control resulting in excellent aesthetics. It is dependable, strong, and more resistant to shock and stress. It can be used in many ways such as bonding lingual retainers, Invisalign® attachments, occlusal build-ups for opening a posterior bite, indirect bonding, and much more! Contains fluoride to help protect against potential decalcification.
